Research Program:

The main recent research fields are hemostasis and thrombosis, hemocompatibility of biomaterials, and the proteomics of cardiovascular and onco-hematologic disorders. The key methodologies are –omics: proteomics, interactomics, complexomics and metabolomics. Proteomic methods are being developed, particularly the construction of protein biochip arrays using surface plasmon resonance (SPR) optical detection. The study of protein expression in leukemic cells and changes of the proteome in relation to the leukemic process.

Research Program:

Cell behaviour *in vitro* by digital holographic and confocal microscopies. Quantitative phase contrast imaging and measurement for analysis of dynamics of cell reactions and interactions with biomaterials. Assessment of chemoresistance/sensitivity of *ex vivo* cells from individual human solid tumours. Development of complex methodology of application of coherence controlled holographic microscope to *in vitro* cell biology and pathology.
